001

1.8 Request for Acknowledgment  
EMAP requests that all individuals who download EMAP data acknowledge the source of these data in any reports, papers, or presentations. If you publish these data, please include a statement similar to: "Some or all of the data described in this article were produced by the U. S. Environmental Protection Agency through its Environmental Monitoring and Assessment Program (EMAP)".

## **2. INVESTIGATOR INFORMATION** (for full addresses see Section 13)

### **2.1 Principal Investigators**

John Paul, U.S. Environmental Protection Agency, NHEERL-Atlantic Ecology Division (AED)  
Charles Strobel, U.S. Environmental Protection Agency, NHEERL-Atlantic Ecology Division (AED)

### **2.2 Sample Collection Investigators**

Charles Strobel, U.S. Environmental Protection Agency, NHEERL-Atlantic Ecology Division (AED)  
Carl Zimmerman, National Park Service (NPS)

### **2.3 Sample Processing Investigators**

George Gardner, U.S. Environmental Protection Agency, NHEERL-Atlantic Ecology Division (AED)  
Sandra Benyi, U.S. Environmental Protection Agency, NHEERL-Atlantic Ecology Division (AED)

## **3. DATA SET ABSTRACT**

### **3.1 Abstract of the Data Set**

The FSH\_SPLN data file contains the results of histopathological examinations testing for spleen macrophage aggregates (SMA) in three target fish: white perch (*Morone americana*), spot (*Leiostomus xanthurus*), and summer flounder (*Paralichthys dentatus*). The fish were collected in both standard and nonstandard trawls. There is one record for each fish examined.

### **3.2 Keywords for the Data Set**

Fish spleen macrophage aggregates, SMA

## **4. OBJECTIVES AND INTRODUCTION**

### **4.1 Program Objective**

The main objectives of the MAIA-Estuaries program are: (1) to evaluate the ecological condition of the Mid-Atlantic estuaries by measuring key properties of the water, sediment, and the community of organisms; (2) to focus attention on small estuaries in order to develop better monitoring approaches for these critical systems; and (3) to develop partnerships among federal and state environmental organizations.

The Environmental Monitoring and Assessment Program (EMAP) is an EPA research and monitoring program designed to provide unbiased assessments of the condition of selected resources over a wide region. A key feature of the program is a probabilistic sampling strategy that randomly selects sampling sites and assigns weighting factors based on area to all measured results. EMAP's strategy was adopted by the Mid-Atlantic Integrated Assessment (MAIA) program, which was designed to assess the conditions of the estuaries, forests, streams and lakes, and agricultural lands in the eight-state Mid-Atlantic region. This file contains data measured in MAIA estuaries during the summer of 1998. Samples were collected for water and sediment analyses primarily in 1997, with a few additional sites sampled in 1998. Fish samples were collected only in 1998. Several estuaries were designated as intensive sites and were sampled in greater detail (see STATIONS file).

The partners in MAIA-Estuaries program are: (1) The U.S. Environmental Protection Agency (USEPA), including both the Atlantic Ecology Division (AED) and the Gulf Ecology Division (GED); (2) National Park Service (NPS) under their project "Maryland Coastal Bays Monitoring"; (3) National Oceanographic and Atmospheric Administration (NOAA) which conducted sampling both in the Delaware Bay (DB) under their "National Status and Trends Program" and in the Carolinian Province (CP); and (4) The Chesapeake Bay Program (CBP), which is a consortium of federal, state, and local governments and nongovernmental organizations. Each partner was responsible for collecting,

processing, and reviewing data. The USEPA Atlantic Ecology Division was responsible for final assembly and review of all data. Laboratories contracted to process samples are specified by the parameter LABCODE included in all data files (Section 4.4). Details regarding use of partner and LABCODE information are presented in the EVENTS metadata file.

#### 4.2 Data Set Objective

The objective of the FSH\_SPLN file is to report the incidence of spleen macrophage aggregates (SMA) in three target fish: white perch (*Morone americana*), spot (*Leiostomus xanthurus*), and summer flounder (*Paralichthys dentatus*).

#### 4.3 Background Discussion

The MAIA program conducted regular fish surveys during the summer of 1998 to characterize the structure and health of the fish communities. The stations sampled were selected according to the probabilistic design described in Section 4.1. These stations were not identical with the stations sampled for water and sediment quality analyses conducted primarily in 1997; therefore, it is not possible to directly compare these different analyses station by station. However, it is statistically valid to compare results among classes of estuaries, e.g., large versus small estuaries, Delaware Estuary versus Chesapeake Estuary, etc.

The information collected in the fish surveys are reported in five data files. FTRAWL includes the number of unique species and the number of fish per standard trawl. FISHSPEC contains the number of fish per species and their average fork length per standard trawl. FISHPATH specifies the frequency and location of pathologies observed in a ship-board inspection, and FSH\_SPLN lists the percent macrophage aggregates observed in a histopathology examination. TISSCHEM reports the concentrations of over 100 chemical analytes measured in composites samples of summer flounder or blue crabs collected at a station. The lookup table FTAXON lists the common and scientific names of all fish identified in the MAIA program. Standard trawls of uniform speed and duration were employed when conducting the fish surveys characterizing the community structure at a site. Additional nonstandard trawls were performed to catch fish for chemical or pathology analyses if sufficient numbers of fish were not available from the standard trawl. Fish from the auxiliary trawls were not included in the standardized counts used to describe community structure.

Macrophage aggregate analysis was performed on the spleens of white perch (*Morone americana*), spot (*Leiostomus xanthurus*), and summer flounder (*Paralichthys dentatus*). These species were selected based on 1992/1993 EMAP-Estuaries data which displayed a good relationship between environmental contamination and incidence of spleen macrophage aggregates, and are found in habitats with salinities typically found in tidal rivers and bays in the mid-Atlantic region. The normal function of spleen macrophage aggregates is to remove damaged or dead cells and debris.

#### 4.4 Summary of Data Set Parameters

*STATION	Station identifier
*EVNTDATE	Date of sampling event
*FTRAWLID	Trawl identifier
*TAX_CODE	Taxonomic code
*FSEQNUM	Fish sequence number
FSPL_PMA	Fish spleen percent macrophage aggregates
YEAR	Year of sampling
* denotes parameters that should be used as key fields when merging data files	

## 5. DATA ACQUISITION AND PROCESSING METHODS

### 5.1 Data Acquisition / Field Sampling

The sample collection methods used by EPA-ORD field crews (PARTNER=AED and GED) will be described here. Any significant variations by other MAIA partners are noted in Section 5.1.12.

#### 5.1.1 Sampling Objective

To collect a representative sample of fish at a station using a standard trawl. Additional nonstandard trawls were conducted when necessary to collect enough fish for histopathology analyses.

#### 5.1.2 Sample Collection and Ship-Board Processing: Methods Summary

The fish trawl was conducted using a funnel-shaped net that filters fish from the near bottom waters. Fish were herded into the net by ground wire and an overhanging panel. Standard trawls were  $10 \pm 2$  minutes in duration with a towing speed of 2-3 knots through the water against the prevailing current (1-3 knots relative to the bottom). An auxiliary, nonstandard trawl was performed to collect fish of four target species if an insufficient quantity were obtained in the standard trawl. The target species were spot (*Leiostomus xanthurus*), white perch (*Morone americana*), summer flounder (*Paralichthys dentatus*), and weakfish (*Cynoscion regalis*). Fish from the auxiliary trawls were used for chemical or pathology analyses only, and were not included in the standardized survey counts used to characterize the fish community structure.

The data reported in the FSH\_SPLN file pertain to fish collected in both standard and nonstandard trawls. All fish in the standard trawls were identified and counted on board ship immediately following the trawl. Fork lengths were measured on the first 30 individuals of each species or on all fish if fewer than 30 individuals of a species were collected. At the same time, a visual inspection for obvious signs of pathology (lumps, growths, ulcers, or finrot) was conducted on all fish measured for length. An auxiliary nonstandard trawl was conducted if insufficient numbers of the target species (spot, white perch, summer flounder and weakfish) were collected in the standard trawl. Up to 15 individuals of the target species spot, white perch, and summer flounder were processed for the spleen macrophage aggregate analysis. In these selected fish, the spleen and liver were removed from the visceral cavity (the entire visceral mass was removed from smaller fish). The tissue was placed in a labeled vial filled with Dietrich's fixative, and sent to the histological lab for analysis.

#### 5.1.3 Beginning Sampling Date

13 July 1998

#### 5.1.4 Ending Sampling Date

14 October 1998

#### 5.1.5 Sampling Platform

All program partners collected samples from various gasoline or diesel powered boats, 25 to 27 feet in length.

#### 5.1.6 Sampling Equipment

The trawl net is a funnel-shaped high-rise sampling trawl. The net includes a 16 meter tow line, a chain sweep, 5 cm mesh wings, and a 2.5 cm cod end.

#### 5.1.7 Manufacturer of Sampling Equipment

Not applicable

#### 5.1.8 Key Variables

Not applicable

#### 5.1.9 Sample Collection: Calibration

The sampling gear does not require calibration

#### 5.1.10 Sample Collection: Quality Control

A trawl was considered void if one or more of the following conditions occurred:

1. Trawl could not be completed because of boat malfunction, vessel traffic, or major disruption

- of gear (trawls aborted after a minimum of 8 minutes were acceptable if the net was retrieved in a standard manner)
2. Boat speed exceeded the prescribed range
  3. The cod-end became untied
  4. The trawl continued for more than 12 minutes or less than 8 minutes
  5. The net was filled with mud or debris
  6. A portion of the catch was lost prior to processing
  7. The tow wire, bridle, head rope, foot rope, or up and down lines became separated
  8. The net was torn in a way that significantly altered the efficiency of the net

If a successful trawl could not be performed within 1½ hours, the site was considered unsampleable. Quality assurance audits were performed to verify the identification and measurement techniques of the field crew. Sample and composite identification numbers were verified during field QA audits. The receiving laboratory verified frozen field samples received against packing invoice, and the samples were stored in a freezer at -20 degrees C until analyzed.

Strobel, C.J. 1998. Environmental Monitoring and Assessment Program - Mid-Atlantic Integrated Assessment. Estuaries Component, Field Operations and Safety Manual. USEPA, Office of Research and Development, NHEERL-AED, Narragansett, RI. July 1998.

#### 5.1.12 Sample Collection: Alternate Methods

Not applicable

### 5.2 Data Preparation and Sample Processing

The processing methods used by USEPA contracts will be described here (LABCODE = CHM-1). Any significant variations by other MAIA partners are noted in Section 5.2.6.

#### 5.2.1 Sample Processing Objective

Examine the fish spleens of the target fish (spot, white perch, summer flounder, and weakfish) for macrophage aggregates.

#### 5.2.2 Sample Processing: Methods Summary

In the histological laboratory, all spleen and liver tissues were examined for obvious changes in coloration and to verify proper fixation. For each station, only the spleens from the largest three fish of each species were processed. All other samples remained stored in the original vials of Dietrich's fixative. Each selected tissue was sectioned, mounted on a slide, and examined under a light microscope for the presence of macrophage aggregates. The percent of area of the spleen occupied by the macrophage aggregates was estimated and reported as one of three categories: < 1%, > 1% (between one and five percent), and > 5% of the area of the spleen.

#### 5.2.3 Sample Processing: Method Calibration

Not applicable

#### 5.2.4 Sample Processing: Quality Control

Each vial labeled with a sample number was checked against a sample shipment list for verification upon arrival at the laboratory and, when verified, the sample number was matched to the station events record to attain the length data for each fish collected. The quality of fixation techniques for fish SMA samples was verified during field QA audits and by the receiving laboratory.

## **8. GEOGRAPHIC AND SPATIAL INFORMATION**

### **8.1 Minimum Longitude (Westernmost)**

-77.4339 decimal degrees

### **8.2 Maximum Longitude (Easternmost)**

-74.7230 decimal degrees

### **8.3 Minimum Latitude (Southernmost)**

34.8702 decimal degrees

### **8.4 Maximum Latitude (Northernmost)**

40.1470 decimal degrees

### **8.5 Name of Region**

MAIA estuary region, consisting of Delaware Bay, Chesapeake Bay, the Delmarva coastal bays, Albemarle-Pamlico Sound, and contiguous estuaries.

## **9. QUALITY CONTROL AND QUALITY ASSURANCE**

### **9.1 Measurement Quality Objectives**

Measurement quality objectives are outlined in the EMAP VA Province Quality Assurance Project Plans (Valente et al., 1990, Valente and Schoenherr, 1991, Valente et al., 1992, Valente and Strobel, 1993). Accuracy and completeness goals are:

Counting	90% accuracy goal	90% completeness goal
Taxon Identification	90% accuracy goal	90% completeness goal

### **9.2 Data Quality Assurance Procedures**

One record for each standard and nonstandard trawl performed at each station is kept. Inspection of the sampling gear for tears or improper assemblage is done at the beginning of every trawl event.

## **10. DATA ACCESS**

### **10.1 Data Access Procedures**

Data can be downloaded from the web

### **10.2 Data Access Restrictions**

None

### **10.3 Data Access Contact Persons**
